

Alaska's Touch Screen Voting Unit

In addition to the regular paper ballot voting process, each precinct in Alaska will have ONE electronic touch screen voting unit during the 2008 Election Year. Touch screen voting is intended for blind and disabled voters; however, any voter may use it.

Although the voter casts an electronic ballot, there is a voter-verifiable paper trail produced by the touch screen. This paper print-out is secured behind a screen and allows the voter to verify the electronic ballot accurately reflects the voter's choices.
